

Coal-Fired Power Plants

Coal-fired power plants are controversial due to air emissions they produce and the debate over the need for additional energy. Discussion and participation is essential to assure that all interested parties have the opportunity to be heard. Our goal is to provide accurate information along with an invitation for public comment as we consider the issues, locations, potential environmental and human health implications,

The Air Quality Division is currently evaluating applications for several new facilities. The proposed plants are going through New Source Review processing. After this assessment is completed, the public will have an opportunity to submit comments and concerns.
